

Evaluation Method

DT Digital Time

Description of the Evaluation Method

The method "Digital Time" evaluates digital signals.

With this evaluation method the digital input channels are sampled and every change in the status of the channel is registered with time. The result of this evaluation method is presented in a logic diagram and in a table.

Typical Applications and Properties

This method is used, for example, to determine whether a clutch is engaged or disengaged; whether a switch is in the on or off position; when a certain gear is shifted in the gear box; when the starter is activated; etc.
